Introduction

What is Myleofibrosis?

- Myleofibrosis is a type of bone marrow cancer in which an rapidly increasing number of blood forming cells form a fibrous like structure that sometimes leads to acute leukemia. Certain genotypes like the JAK2 V617F mutation have been a determining factor of Blast Transformation in Myleofibrosis.

What is differential gene expression?

- Differential gene expression is a way to analyze factors in different groups that may or may not be associated with different gene counts, from RNA sequence data.

What is gene expression?

- Gene expression is the process of which information inside a gene is used to make RNA and proteins. The genotype leads to the phenotype.

Why is differential gene expression important to a biological question?

How to do differential gene expression:

What inputs go in:

24 patients, 12 MF, 12 normal ### What is the analysis going to do

What are the outputs/what is the meaning of the outputs

(My) Experimental Design

What groups am I going to compare? (Bio factors vs. tech factors)

- The groups of phenotype data being used can be sorted into two overarching categories: biological factors and technical factors. Biological factors include "Tissue_type", "genotype_jak2", "genotype_calr", and "genotype_mpl". Technical factors include: "collection_type", "time_to_processing", and "extraction_type".
- The reason why I am splitting the data/analysis into two categories is to attempt to see whether certain factors from each category have an impact on specific gene counts or not.
- To be completed: Why im picking each of the columns within those sections
- I will separate demographic groups by phenotype, and compare gene expression counts for each of the genes between the two groups, groups defined by conditions of that factor. For example, the conditions of the factor of age could be different age groups, sex could be male or female, genotype could be present or not present, etc. ultimate goal is to make observations/conclusions about possible differences in gene counts between different groups that may or may not be significant in diagnosis of Myleofibrosis.

Data Import

Install R Packages

Installs packages of functions that can be used to help manipulate variables and data libraries. These packages can be installed through base R code that downloads them and installs them into R studio. Then certain programming phrases can be used to do new functions in connection with base R programming phrases, with an indicator of the package being used mentioned before using that package's functions. For example, if I wanted to use a function of the "dplyr" package, I would write -> "dplyr::(insert function here)(insert arguments of functions here)". Note that functions or phrases that are in base R programming vocabulary do not require a name indicator of the package being used, as it is from the base software and the software knows how to interperet those phrases without an idicator of a package. It is still required to write names of functions from Base R that are wanting to be used though, and if shortcut variables for functions are desired then you can assign new variables to those functions.

Bioconductor packages need to be installed by "biocLite" rather than install.packages which is for CRAN/base R

```r
install.packages("dplyr")
install.packages("knitr")
install.packages("rmarkdown")
install.packages("corrplot")
install.packages("tidyr")
install.packages("tibble")
### Install Bioconductor, the DESeq2 Package and ggplot2
source("https://bioconductor.org/biocLite.R")
biocLite("DESeq2")
install.packages("ggplot2")
```

Load Additional Packages

```r
library(DESeq2); library(ggplot2)
library(plyr); library(corrplot)
library(tidyr); library(dplyr)
library(gghighlight);
library(tibble)
```

Read in Project Metadata to R

Reads the two CSV's and combines them into one data frame: The code below creates three data frames: one labeled as "df_pheno" for data of a file called phenotable, which contains demographics and general information from patients and samples taken from them, another labeled as "df_molecular" for data from another file called molecularDataSets, which contains more specific info on samples collected from patients and their diagnoses from these samples, and another labeled as "df_combined" that combines the two data frames according to common columns.

The overall purpose of this code chunk is to create the combined data frame.

The first two data frames created ("df_pheno" and "df_molecular") were created using base R code "read.csv" function, which reads in data into a data frame from a CSV, a comma seperated values document.

In the process of formatting the df_pheno dataframe in order to be compatible when joining with the df_pheno dataframe, the "rename" function from the dplyr package is used on the df_pheno dataframe to change the name of a mismatching column name.

The function used to actually combine the two dataframes into one is the "full_join" function from the dplyr package which joins two indicated dataframes together by a common column.

"str()" is short for structure, and is a base R function that allows the user to get an idea of the format of the data they are looking at

```r
df_pheno <- read.csv(file="../RNASeqData/phenotypeTable.csv",
                     header =TRUE)
df_pheno <- df_pheno %>% rename(assay_material_id = ends_with("assay_material_id"))

df_molecular <- read.csv(file="../RNASeqData/molecularDataSets.csv",
                         header =TRUE, sep=",")

df_combined <- dplyr::full_join(df_pheno, df_molecular,
                                by = "assay_material_id")
head(df_combined, n = 3)
```

```

Save Prepared Metadata

Writes a CSV (a comma seperated values document) from the new combined data frame(df_combined) of dataframes df_pheno and df_molecular into a document called "combineddata.csv" stored in the working directory (the main location of the files created from the Rstudio

```
write.csv(df_combined, file = "../ProjectFiles/combineddata.csv",
          row.names = FALSE)
```

The read.csv function is used to re-read the newly written CSV to make sure the data is the same as it was when written. The "str()" and "summary" functions are used to compare the statistics of the new dataframe to the original created one to confirm similarity.

```
test_set_combined_data <- read.csv("combineddata.csv")
str(test_set_combined_data)
```

Read in RNA Sequencing Data from HiSat2/htseqcount

Makes a list of directories(folders) with the R base function "list.dirs" which takes the indicated path of the main directory containing the directories its making a list of in, and the econd argument written "recursive" is set to false becuse the main directory is not desired to be listed in the list of its components.

```
#":/Users/gfortenb/Documents/GitHub/bioDS-bootcamp/RNASeqData"
RNADirectoryList = list.dirs(path = "../RNASeqData", recursive = FALSE)
```

Makes a List of files within each folder of each directory in the main directory. Uses a function to go through the files within each folder and only list files with a certain phrase in the name of the file, "htseq.txt", using the pattern function (only argument usedin function is name of character phrase its looking for).

Binds path's of files(locations of the files in the computer) on the list made to the molecular ID of the files with "as.data.frame"" function"/"cbind" function, created by finding key character sequences in the title of the folders containing the "htseq.txt"" files, using the gsub function (from base R). The first argument used in the gsub function is a character phrase that indicates where in the string to look for the character phrase of the molecular ID, and the second argument is the list of data of file locations/names to look for the ID in.

The "colnames" function (base R) sets the column names if the newly created dataframe.

```
FileList_htseq1 = sapply(RNADirectoryList,
                   function(x){list.files(path = x,
                                          full.names = TRUE,
                                          pattern = "htseq.txt") })

htseq_FileID_df <- as.data.frame(cbind(FileList_htseq1,
                                 gsub("^.*-","", RNADirectoryList)),
                            stringsAsFactors = F)
colnames(htseq_FileID_df) <- c("Path", "molecular_id")
head(htseq_FileID_df, n = 3)
```

```
##
## ../RNASeqData/JAK2-10-1-D-R0299-M00000300 ../RNASeqData/JAK2-10-1-D-R0299-M00000300/JAK2-10-1-D.htsec

Create a Summarized Experiment Data set

("Summarized Experiment" - something specific to DESeq2 package) - Normalize RNA Sequencing Counts - in new normalized data frame - (Normalize each sample's counts data based on over all library size for each sample.)

Data Setup For Analysis

Differential Gene Expression Analysis with DESeq2

HERE DOWN->

Make the list of dataframes into one dataframe w/all contents of each dataframe in the dataframe of dataframes as columns using the "join_all" function from the plyr package. This produces a dataframe with the molecular ID and Genes in each sample assigned to a molecular ID columns.

```
###THIS MATTERS- MOLECULAR ID's LINKED TO THE PHENOTABLE
htseq_genecounts_df <- plyr:: join_all(listOf_alldf, by = NULL,
                                 type = "full", match = "all")
head(htseq_genecounts_df, n = 1)
```

```
##   Gene M00000300 M00000302 M00000304 M00000305 M00000298 M00000297
## 1 A1BG       226       138       233       438       130       148
##   M00000299 M00000301 M00000303 M00000306 M00000307 M00000308 M00000019
## 1        88       163        88       132       232       240       119
##   M00000020 M00000021 M00000022 M00000002 M00000001 M00000003 M00000004

Creating original DeseqDatasets

(EDITS = DONE)

```r
#DataSet for DESEQ from HTSEQ Matrix created
# variable comparing is diagnosis [levels  = mf (myleofibrosis) and normal (no myleofibrosis) ]
dseq_set_htseq <- DESeqDataSetFromMatrix(htseqCountsMat,phenoMat, design = ~ diagnosis)

# with base level being at "normal" (not myleofibrosis)
dseq_set_htseq$diagnosis <- relevel(dseq_set_htseq$diagnosis, "normal")
```

```r
#gets rid of rows of gene counts of 1's and 0's
dseq_set_htseq <- dseq_set_htseq[ rowSums(counts(dseq_set_htseq)) > 1, ]
```

```r
dseq_set_salmon <- DESeqDataSetFromMatrix(salmonCountsMat,phenoMat, design = ~ diagnosis)

dseq_set_salmon$diagnosis <- relevel(dseq_set_salmon$diagnosis, "normal")

dseq_set_salmon <- dseq_set_salmon[ rowSums(counts(dseq_set_salmon)) > 1, ] #gets rid of 1's and 0's
#head(dseq_set_salmon)
```

Creating copies of original datasets for analysis/design formulas

```r
###base lvl = age range
dseq_set_htseq_copy2 <- dseq_set_htseq
design(dseq_set_htseq_copy2) <- formula(~ age_range)
dseq_set_htseq_copy2 <- DESeq(dseq_set_htseq_copy2)
```

```
## estimating size factors

## estimating dispersions

## gene-wise dispersion estimates

## mean-dispersion relationship

## final dispersion estimates

## fitting model and testing

## -- replacing outliers and refitting for 5261 genes
## -- DESeq argument 'minReplicatesForReplace' = 7
## -- original counts are preserved in counts(dds)

## estimating dispersions

## fitting model and testing
```

```r
dseq_set_salmon_copy <- dseq_set_salmon
design(dseq_set_salmon_copy ) <- formula(~ diagnosis)
dseq_set_salmon_copy  <- DESeq(dseq_set_salmon_copy )
```

```
## estimating size factors

## estimating dispersions

## gene-wise dispersion estimates

## mean-dispersion relationship

## final dispersion estimates

## fitting model and testing

## -- replacing outliers and refitting for 623 genes
## -- DESeq argument 'minReplicatesForReplace' = 7
## -- original counts are preserved in counts(dds)

## estimating dispersions

## fitting model and testing
```

Analysis

use Deseqdataset to do analysis using deseq2 tools???

Following paragraph/description Copied from https://bioconductor.org/packages/release/bioc/vignettes/DESeq2/inst/doc/DESeq2.html#differential-expression-analysis . . . IMPORTANT!!!!!!!!!!

A DESeqDataSet object must have an associated design formula. The design formula expresses the variables which will be used in modeling. The formula should be a tilde (~) followed by the variables with plus signs between them (it will be coerced into an formula if it is not already). The design can be changed later, however then all differential analysis steps should be repeated, as the design formula is used to estimate the dispersions and to estimate the log2 fold changes of the model.

Note: In order to benefit from the default settings of the package, you should put the variable of interest at the end of the formula and make sure the control level is the first level.

Gives results of HTSEQ design formula 1:

```
res_dseq_set_htseq_copy <- results(dseq_set_htseq_copy)
head(res_dseq_set_htseq_copy, n = 2)
```

```
## log2 fold change (MLE): diagnosis mf vs normal
